

Class Group Exercise: Specification of a 0-Interface

Design and document an *IList-interface*.

It should allow

1. the **creation** of lists of **any** kind of object (e.g. list of customers, list of contracts, ...) and even mixed lists (e.g. containing customers and contracts).
2. all useful **operations** on lists (e.g. inserting a new element, sorting, ...).

You have completed the exercise successfully if your specification

- fulfills both 1) and 2) and
- is well documented (possibly with diagrams and examples), easy-to-understand and will lead to no misunderstandings with users and implementers of your specification. Moreover it should neither be overspecified nor underspecified.

You should be able to **present** your results.
